Key Steps — Intramuscular injection — gluteal site

The key steps for this skill, in the order they are demonstrated in the video. Part of our Medication Administration skills collection.

- ☐ 1. Verify the medication order, and check the patient's identity and allergies.
- ☐ 2. Perform hand hygiene and prepare sterile equipment — and keep it sterile throughout.
- ☐ 3. Draw up the medication and confirm the dose before approaching the patient.
- ☐ 4. Position the patient and find the gluteal site: divide the buttock into quadrants and use the centre of the upper outer quadrant, clear of the sciatic nerve and major blood vessels.
- ☐ 5. Clean the site with an alcohol prep using a circular, outward motion, and let it dry.
- ☐ 6. Firm the tissue by squeezing it between your thumb and fingers.
- ☐ 7. Insert the needle with a quick thrust at a 90-degree angle to the skin.
- ☐ 8. Aspirate by gently pulling back the plunger. If blood appears, do not inject — withdraw, apply direct pressure, and start again with a new sterile setup.
- ☐ 9. Inject the medication steadily.
- ☐ 10. Withdraw the needle and massage the site gently.
- ☐ 11. Dispose of the needle and syringe in a sharps container, and document the medication, dose, site and time.
